

Alex Road Service

Public Website + Operations Platform

Brand + UI styling system derived from truck wrap visuals, logo treatment, and service positioning.

Document purpose

Define a cohesive brand, website, and UI styling system for the Alex Road Service public website and the internal operations platform. The system is derived from the truck wrap visuals, logo treatment, and service positioning shown in the uploaded images.

Brand feel: Bold, urgent, industrial

Primary accent: #E51F2B

Core neutrals: Black, steel gray, off-white

Interface tone: High clarity, fast-action, mobile-first

1. Brand Direction

Alex Road Service should present itself as an emergency-first heavy-duty service brand: fast, credible, mechanical, and action-oriented. The visual system should feel like the side of a service truck—clean white field, sharp black motion graphics, and high-visibility red accents used to direct attention to the call to action.

Core personality	Reliable, urgent, hands-on, industrial, practical, no-nonsense.
Visual keywords	Truck wrap graphics, motion slashes, service bay energy, field technician utility.
Brand promise	Fast roadside support, clear communication, and organized service records.
Audience feel	Fleet managers, dispatchers, owner-operators, and commercial clients should immediately trust the brand.
Design rule	Always prioritize readability, phone-first CTAs, and obvious status states over decorative design.

2. Color System

The truck wrap suggests a simple but effective palette: one dominant emergency red, deep black for contrast, white/off-white for clarity, and supporting steel grays for utility surfaces.

Recommended Brand Palette

					
Primary Red #E51F2B	Signal Red Dark #6A2026	Jet Black #171A1A	Steel Gray #64635D	Warm Gray #9F9E96	Off White #F5F7F8

Color	Hex	Usage	Notes
Primary Red	#E51F2B	Primary CTAs, key stats, active states, urgent alerts	Use intentionally. One red CTA per section is stronger than many.
Dark Red	#6A2026	Pressed buttons, destructive actions, alert headers	Do not use for large backgrounds.
Jet Black	#171A1A	Headlines, nav bars, sidebars, icons	Primary contrast anchor.
Steel Gray	#64635D	Borders, secondary buttons, muted labels	Good for ops platform shells.
Warm Gray	#9F9E96	Dividers, disabled states, helper text	Keeps the UI from feeling harsh.
Off White	#F5F7F8	Page backgrounds, cards, forms	Preferred over pure white for larger UI areas.

3. Typography + Logo Treatment

Headline style — Use bold condensed sans-serif headlines that echo the truck graphics and service urgency. Recommended web options: Bebas Neue, Oswald, Teko, or Anton for hero headlines and section labels.

Body style — Use a highly readable sans-serif for body copy and the operations platform. Recommended options: Inter, Roboto, Source Sans 3, or system UI fonts.

Numerals — Phone numbers, invoice totals, labor hours, and KPI values should use heavy numeric styling with generous spacing.

Logo handling — Keep the Alex Truck Service logo on clean light backgrounds when possible. Leave clear breathing room around the gear mark and do not crowd it with competing graphics.

Text effects — Avoid outlines, glows, or decorative shadows in the digital product. The truck wrap can carry harder visual effects; the website and app should feel cleaner and more premium.

4. Photography + Graphic Language

- Use real truck, service bay, roadside support, mechanic hands, hydraulic hose, and fleet imagery whenever possible.
- Graphic accents should borrow from the truck wrap: diagonal motion slashes, high-contrast arrows, and red directional cuts.
- Do not overuse graphics in the operations platform. Reserve them for dashboards, empty states, section dividers, or the public site hero.
- Crop photos wide and practical. Show work in progress, equipment, wheels, hose assemblies, and commercial context rather than generic stock imagery.

5. Public Website Styling System

The public website should feel like a fast-response commercial service brand. It should be bold, easy to skim on mobile, and designed around immediate action: call, request service, or log in.

Area	Styling Direction	Functional Goal
Header/Nav	White or off-white header, black logo/text, primary red call button, clear Login button to platform.	Make trust and navigation instant.
Hero	Truck image or action photo, bold condensed headline, one emergency CTA, one secondary CTA.	Communicate speed and capability in the first screen.
Service sections	Use white card sections with black headings and small red accent bars or icons.	Keep services readable and scannable.
Emergency banner	Persistent red or black banner with phone number and '24/7 Roadside' messaging.	Drive calls from mobile users.
Testimonials	Simple cards with strong spacing, not overly styled.	Support credibility without clutter.
Footer	Dark background with contact info, service areas, and quick links.	Close with trust, location, and action.

Public website components

Primary button: Solid #E51F2B, white text, medium radius, bold label, hover darkens slightly.

Secondary button: White fill with 1 px dark border, dark text, subtle shadow only if needed.

Cards: Off-white surface, 12–16 px radius, light border, plenty of vertical spacing.

Forms: Large mobile-friendly fields, dark labels, red focus state, obvious submit button.

Icons: Use line or solid icons in black/red only. Avoid more than one icon style family.

Map/contact block: Put phone, address, hours, and map in one clean section with strong contrast.

Public site page tone by page

- **Home** — Most visual and conversion-oriented. Hero should lead with speed, reliability, and roadside/fleet service.
- **Services** — Structured by service category with proof points and CTA after each major section.
- **Emergency roadside** — Highest urgency page; red accents can be heavier here than on the rest of the site.
- **About** — More restrained; use trust-building copy, experience, and service area.
- **Contact / request service** — Most form-driven page; prioritize completion rate over decoration.

6. Operations Platform Styling System

The operations platform should keep the brand DNA but become more restrained and utilitarian. The platform is a productivity tool first: fast scanning, easy status recognition, and clear data entry.

Area	Recommended Styling	Rationale
Sidebar	Jet black or deep charcoal with white nav labels and red active indicator.	Creates strong structure and fast orientation.
Top bar	White/off-white with page title, search, alerts, and user menu.	Keeps content area bright and readable.
Dashboard cards	White cards with subtle border and one red accent metric or icon.	Feels modern while still branded.
Tables	High readability, sticky headers, muted borders, row hover highlight, colored status chips.	Important for work orders, invoices, and inventory.
Forms	Single-column on mobile, two-column on desktop where appropriate, helper text in gray.	Reduces errors for staff in the field.
Alerts	Red for urgent issues, amber for warnings, gray/blue-neutral for informational notices.	Makes workflow states instantly recognizable.

Operations platform status colors

Status	Color treatment	Guidance
Open	Light gray chip + dark text	Default neutral state.
In Progress	Red outline or light red fill	Show active technician work.
Waiting Parts	Muted amber / warm gray accent	Should read as delayed but not failed.
Completed	Dark text with subtle success accent	Keep calm and readable.
Invoiced / Paid	Neutral-to-success treatment	Paid state should feel resolved, not urgent.
Low Inventory	Red text or red indicator dot	Needs fast attention.

Ops platform component standards

Navigation — Use simple labels: Dashboard, Customers, Trucks, Work Orders, Estimates, Invoices, Payments, Inventory, Reports.

Buttons — Reserve primary red for create/save/important actions. Use gray or outline buttons for secondary actions.

KPI cards — Large number, small descriptive label, optional trend marker. No more than one bright accent per card.

Tables — Use dense-but-readable spacing; short columns centered, narrative columns left-aligned.

File/photo uploads — Show preview thumbnails in clean white cards with clear remove and replace actions.

Mobile technician mode — Prioritize large tap targets, one-column layouts, sticky bottom actions, and minimal form friction.

7. Layout, Spacing, and Interaction Rules

- Use a 12-column grid on desktop and a 4-column or single-column stack on mobile.
- Default section spacing on the public site should feel generous; default spacing in the operations platform should feel compact but not cramped.
- Primary CTA placement: one per major viewport section on the public site; one dominant action per workspace area in the platform.
- Use 12–16 px radius on public site cards and 10–14 px radius in platform cards/modals.
- Hover states should be subtle; state clarity should come from contrast, spacing, and color, not animation-heavy effects.
- Keep shadows light and modern. The brand is industrial, but the digital product should still feel premium and clean.

8. Accessibility + Practical UX Rules

- Maintain strong color contrast, especially red on white or white on red text combinations.
- Never rely on color alone for operational status; pair statuses with labels or icons.
- Phone numbers and emergency actions must be instantly tappable on mobile.
- Use large field labels and obvious validation messaging for office staff and technicians.
- Keep table text, invoice totals, and labor fields highly legible in bright shop or roadside environments.

9. Recommended Starter UI Tokens

Token group	Recommendation
Border radius	12 px public site cards; 10 px tables/modals; 999 px pill chips.
Spacing scale	4, 8, 12, 16, 24, 32, 48.
Headline weights	700–800 equivalent.
Body sizes	14–16 px public site; 13–15 px operations platform.
Icon sizing	18–20 px interface icons; 24 px high-emphasis icons.
Button heights	44–52 px depending on context; mobile min 48 px.
Input heights	44–48 px standard fields; textareas grow naturally.
Table row heights	44 px minimum for dense admin tables; 52 px for touch-heavy screens.

10. Final Implementation Summary

Use the truck wrap as the emotional brand anchor, not as a literal UI template. The public website should be bold, promotional, and conversion-focused; the operations platform should be cleaner, more restrained, and

optimized for speed. Across both products, keep the palette simple, the typography strong, and the calls to action unmistakable.
